

REPLACE COULTERS FOR BETTER UPTAKE, REDUCED MAINTENANCE

Traditional sidedress methods apply nitrogen in the middle of the crop row – nearly 15 inches from the base of the plant. This increases the chance of loss, especially in years lacking significant rainfall. 360 Y-DROP Sidedress allows for precise placement of N 2-3 inches from the stalk base – right where the plant needs it most. 360 Y-DROP Sidedress extends the window for application well into V6 to provide you with more flexibility in your application.

KEY FEATURES

Adjustable riser length allows for mid to late season nitrogen application as late as V7 and four position adjustable arms allow for precision nitrogen placement in 15-36" rows.

Breakaway risers provide protection on uneven terrain and variable rate nozzles are available for precise rate control.

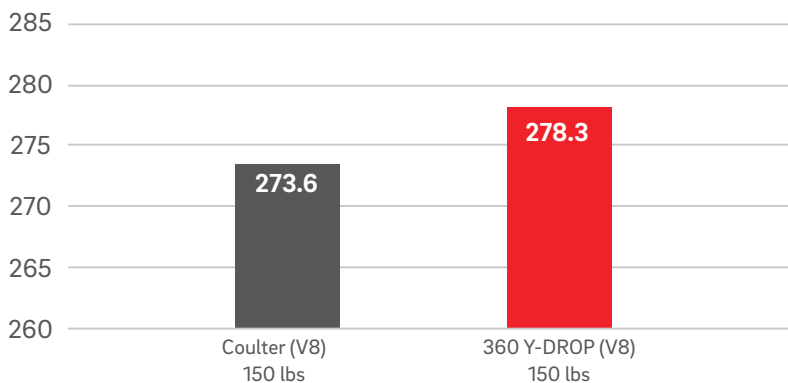

Simple retrofit for your current coultter bar. And, add even more value by installing 360 UNDERCOVER on your sidedress bar and use it for insecticide and fungicides in soybeans, cotton and more.

+ CONVERT YOUR COULTER BAR

Upgrade your coultter applicator system with 360 Y-DROP Sidedress and place nitrogen right above the root zone, where one heavy dew or light rainfall can move nitrogen into the soil for rapid uptake. Plus, 360 Y-DROP Sidedress eliminates the height limit of coultters, giving you up to three more collars of application window to help lower application risk.

+ 2016 PLACEMENT STUDY - 4.7+ BUSHEL BOOST

Tremont, Illinois

- Base rate of 25#N (W&F) + S and 60#N + S (planter)
- Sulfur applied at 1#S per every 10#N

A successful year is being able to get the crop planted, get nutrients applied in spring, and get harvested in the fall all in a timely fashion. In the end, 360 Y-DROP Sidedress helps our bottom line by allowing us to put nitrogen on in a timely manner, what you need - when you need it.
